Dr Eyerman

Dear

Oct Nov. 1/19 I picked up this Euphorbia among some ballast plants near Centerville Long Is. - Near by a week before I found a strange composite - I sent both to Dr Gray. The composite he says is Cenia turbinata from So. Africa. The Euphorbia he did not recognize, & suggested my sending it to you. It may belong to So. Africa, or Europe, or So. America - Ballast in that location comes from all quarters of the globe. I have gathered 150 species of foreign seeds this season - many of them not before reported in this country. A list will be published in the Nov. Bulletin. I would like to add the name of this, if you recognize it. This specimen is about 1/2 of the plant - but little was found - and it is probably a quite weak & small specimen as the season was so late. It was a growth from quite recent ballast. The Philistines there tear up everything

boy son, and suppose nothing to
get any start. If you do not care
to retain the specimen I should
like it again; if you wish it,
keep it.

Very truly yrs
